Abstract

In this paper we propose a fuzzy Laplace transform to solve fuzzy initial value problem under strongly generalized differentiability concept. The fuzzy Laplace transform of derivative was used to solve Nth-order fuzzy initial value problem. To illustrate applicability of proposed method we plot graphs for different values of r-level sets by using Mathematica Software.

Keywords—Fuzzy numbers, Fuzzy valued function, Hakuhara derivatives, Strongly generalized differentiability, Method of fuzzy Laplace transform, Fuzzy initial value problems.
1 Introduction

Fuzzy Differential equation is very much useful to solve to differential equation that occurs in field of Engineering, physical mathematics as well as mathematics. The concept of a fuzzy derivative was first introduced by Chang and Zadeh [19] followed up by Dubois and Prade[16] who used the extension principle in their approach. Other fuzzy derivative concepts were proposed by Puri and Ralescu [17] and Goetschel and Vaxman [24] as an extension of the Hukuhara derivative of multivalued functions. Kandel and Byatt[1] applied the concept of fuzzy differential equation to the analysis of fuzzy dynamical problems. The FDE and the initial value problem (Cauchy problem) were rigorously treated by Kaleva [13,14], Seikkala [20].

Strongly generalized differentiability was introduced and studied by Bede et al.[5,6] the existence and uniqueness theorem of solution of Nth-order fuzzy differential equations under generalized differentiability was studied by S. Salahshour [18]. In 2015, Patel and Desai [15] find solution of variable coefficient fuzzy initial value problems by properties of Linear Transmrtion. The strongly generalized derivative is defined for a larger class of fuzzy valued function than the H-derivative, and fuzzy differential equations can have solutions which have a decreasing length of their support. So we use this differentiability concept in the present paper.
The Laplace transform method on fuzzy Nth-order derivative solves FLDEs in and corresponding fuzzy initial and boundary value problems. In this way Laplace transforms reduce the problem to an algebraic problem. The fuzzy Laplace transform also has the advantage that it solves problems directly, fuzzy Nth-order initial value problems without first determining a general solution and non homogeneous differential equations without first solving the corresponding homogeneous equation.

2 Preliminaries

2.1 Fuzzy Number

A fuzzy number is a fuzzy set like \( u: R \rightarrow I = [0,1] \) which satisfies:

1. \( u \) is upper semi-continuous.
2. \( u \) is fuzzy convex i.e. \( \lambda x + (1 - \lambda) y \geq \min \{ u(x), u(y) \} \) \( \forall x, y \in R, \lambda \in [0,1] \)
3. \( u \) is normal i.e \( \exists x_0 \in R \) for which \( u(x_0) = 1 \)
4. \( \supp u = \{ x \in R | u(x) > 0 \} \) is support of \( u \), and its closure \( cl(\supp u) \) is compact.

2.2 \( r \)-Level Sets

Let \( E \) be set of all real fuzzy numbers on \( R \). The \( r \)-level set of fuzzy number \( u \in E \), \( 0 \leq r \leq 1 \), denoted by \( [u]_r \), is defined as

\[
[u]_r = \begin{cases} 
\{ x \in R | u(x) \geq r \} & \text{if } 0 \leq r \leq 1 \\
cl(\supp u) & \text{if } r = 0
\end{cases}
\]

It is clear the \( r \)-level set of a fuzzy number is a closed and bounded interval \( [(u(r), \bar{u}(r))] \), where \( u(r) \) denote left-hand endpoint of \( [u] \), and \( \bar{u}(r) \) denote right-hand endpoint of \( [u]_r \). Since each \( y \in R \) can be regarded as a fuzzy number \( y \) defined by

\[
\tilde{y}(t) = \begin{cases} 
1 & \text{if } t = y \\
0 & \text{if } t \neq y
\end{cases}
\]

\( R \) can be embedded in \( E \).

2.3 Parametric form of Fuzzy Number

A fuzzy number \( u \) in a parametric form is a pair \((y, \bar{u})\) of functions \((u(r), \bar{u}(r))\), \( 0 \leq r \leq 1 \), which satisfies the following requirements:

1. \( u(r) \) is a bounded monotonic increasing left continuous function,
2. \( \bar{u}(r) \) is a bounded monotonic decreasing left continuous function,
3. \( u(r) \leq \bar{u}(r), 0 \leq r \leq 1 \).

A crisp number \( \alpha \) is simply represented by \((u(r), \bar{u}(r)) = \alpha, 0 \leq r \leq 1 \). we recall that for \( a < b < c \) which \( a, b, c \in R \) the triangular fuzzy number \( u = (a, b, c) \) determine by \( a, b, c \) is given such that

\[
u(r) = a + (b - a)r \quad \text{and} \quad \bar{u}(r) = c - (c - b)r
\]

are endpoints of \( r \)-level sets, for all \( r \in [0,1] \).
2.4 Properties of Fuzzy Valued Number

For arbitrary \( u = (u(r), \bar{u}(r)), v = (v(r), \bar{v}(r)), \) \( 0 \leq r \leq 1 \) and arbitrary \( k \in R \).

We define addition, subtraction, multiplication, scalar multiplication by \( k \).

\[
\begin{align*}
    u + v &= (u(r) + \bar{v}(r), \bar{u}(r) + \bar{v}(r)) \\
    u - v &= (u(r) - \bar{v}(r), \bar{u}(r) - \bar{v}(r)) \\
    u \cdot v &= (\min\{u(r)v(r), u(r)\bar{v}(r), \bar{u}(r)v(r), \bar{u}(r)\bar{v}(r)\}, \\
                \max\{u(r)\bar{v}(r), u(r)v(r), \bar{u}(r)v(r), \bar{u}(r)\bar{v}(r)\}) \\
    ku &= \begin{cases} 
        (ku(r), k\bar{u}(r)) & \text{if } k \geq 0 \\
        (k\bar{u}(r), ku(r)) & \text{if } k < 0 
    \end{cases}
\end{align*}
\]

3  Hukuhara Difference, Generalized And Strongly Generalized Differentiability

3.1 Hukuhara difference

Let \( x, y \in E \). If there exists \( z \in E \) such that \( x = y + z \), then \( z \) is called the Hukuhara difference of fuzzy numbers \( x \) and \( y \), and it is denoted by \( z = x \odot y \).

The \( \Theta \) sign stands for Hukuhara-difference, and \( x \odot y \neq x + (-1)y \).

3.2 Hukuhara differential

Let \( f: (a, b) \rightarrow E \) and \( t_0 \in (a, b) \) if there exists an element \( f'(t_0) \in E \) such that for all \( h > 0 \) sufficiently small, exists \( f(t_0 + h) \odot f(t_0), f(t_0) \odot f(t_0 - h) \) and the limits holds(in the metric \( D \))

\[
\lim_{h \to 0} \frac{f(t_0 + h) \odot f(t_0)}{h} = \lim_{h \to 0} \frac{f(t_0) \odot f(t_0 - h)}{h} = f'(t_0)
\]

3.3 Generalized Hukuhara Derivative

Let \( f: (a, b) \rightarrow E \) and \( t_0 \in (a, b) \) we say that \( f \) is (1)- differentiable if there exists an element \( f'(t_0) \in E \) such that for all \( h > 0 \) sufficiently small, exists \( f(t_0 + h) \odot f(t_0), f(t_0) \odot f(t_0 - h) \) and the limits holds(in the metric \( D \))

\[
\lim_{h \to 0} \frac{f(t_0 + h) \odot f(t_0)}{h} = \lim_{h \to 0} \frac{f(t_0) \odot f(t_0 - h)}{h} = f'(t_0)
\]

\( f \) is (2)-differentiable if there exists an element \( f'(t_0) \in E \) such that for all \( h > 0 \) sufficiently small, exists \( f(t_0) \odot f(t_0 + h), f(t_0 - h) \odot f(t_0) \) and the limits holds(in the metric \( D \))

\[
\lim_{h \to 0} \frac{f(t_0 + h) \odot f(t_0 + h)}{-h} = \lim_{h \to 0} \frac{f(t_0 - h) \odot f(t_0)}{-h} = f'(t_0)
\]

If \( f'(t_0) \) exist in above cases then i.e. called Generalized fuzzy derivative of \( f(t) \).
3.4 Strongly generalized differential

Let \( f: (a, b) \to E \) and \( t_0 \in (a, b) \) we say that \( f \) is strongly generalized differential if there exists an element \( f'(t_0) \in E \) such that

(i) for all \( h > 0 \) sufficiently small, exists
\[
\lim_{h \to 0} \frac{f(t_0 + h) \Theta f(t_0)}{h} = \lim_{h \to 0} \frac{f(t_0) \Theta (f(t_0) - h)}{h} = f'(t_0) \text{ or}
\]

(ii) for all \( h > 0 \) sufficiently small, exists
\[
\lim_{h \to 0} \frac{f(t_0) \Theta (f(t_0) + h)}{h} = \lim_{h \to 0} \frac{f(t_0) \Theta (f(t_0) - h)}{h} = f'(t_0) \text{ or}
\]

(iii) for all \( h > 0 \) sufficiently small, exists
\[
\lim_{h \to 0} \frac{f(t_0 + h) \Theta (f(t_0) - h)}{h} = \lim_{h \to 0} \frac{f(t_0) \Theta (f(t_0) + h)}{h} = f'(t_0) \text{ or}
\]

(iv) for all \( h > 0 \) sufficiently small, exists
\[
\lim_{h \to 0} \frac{f(t_0) \Theta (f(t_0) + h)}{h} = \lim_{h \to 0} \frac{f(t_0) \Theta (f(t_0) - h)}{h} = f'(t_0)
\]

(\( h \) and \( -h \) at denominators mean \( \frac{1}{h} \) and \( \frac{1}{-h} \), respectively)

**Theorem:** Let \( f: R \to E \) be function and denote \( f(t) = (\tilde{f}(t), \check{f}(t)) \) for each \( r \in [0, 1] \). then

1. If \( f \) is (i)-differentiable, then \( f(t) \) and \( \tilde{f}(t) \) are differentiable function and
\[
f'(t) = (\tilde{f}'(t), \check{f}'(t))
\]

2. If \( f \) is (ii)-differentiable, then \( f(t) \) and \( \check{f}(t) \) are differentiable function and
\[
f'(t) = (\tilde{f}'(t), \check{f}'(t))
\]
4 Method Of Fuzzy Laplace Transform

Let \( f(t) \) be continuous fuzzy-valued function. Suppose that \( f(t)e^{-st} \) improper fuzzy Riemann integrable on \([0, \infty)\) then \( \int_0^\infty f(t)e^{-st}dt \) is called fuzzy Laplace transforms and is defined as

\[
L[f(t)] = \int_0^\infty f(t)e^{-st}dt
\]

we have

\[
\int_0^\infty f(t)e^{-st}dt = (\int_0^\infty f(t)e^{-st}dt, \int_0^\infty f(t)e^{-st}dt)
\]

also by using definition of classical Laplace transform:

\[
l[f(t,r)] = \int_0^\infty f(t)e^{-st}dt
\]

then we follow

\[
L[f(t)] = (l[f(t,r)], l[f(t,r)])
\]

**Theorem:** 2 Let \( f(t) \) be an integrable fuzzy-valued function, and \( f(t) \) is the primitive of \( f'(t) \) on \([0, \infty)\) then

\[
L[f'(t)] = sL[f(t)] \Theta f(0)
\]

where \( f \) is (i)-differentiable

or

\[
L[f'(t)] = (-f(0)) \Theta (-sL[f(t)])
\]

Where \( f \) is (ii) differentiable

**Theorem:** 3 Let \( f''(t) \) be integrable fuzzy-valued function, and \( f(t), f'(t) \) are primitive of \( f'(t), f''(t) \) on \([0, \infty)\). Then

\[
L[f''(t)] = s^2L[f(t)] \Theta s f(0) \Theta f'(0)
\]

where \( f \) is (i)-differentiable and \( f' \) is (i)-differentiable or

\[
L[f''(t)] = s^2L[f(t)] \Theta s f(0) - f'(0)
\]

where \( f \) is (ii)-differentiable and \( f' \) is (ii)-differentiable or

\[
L[f''(t)] = \Theta (-s^2)L[f(t)] - s f(0) - f'(0)
\]

where \( f \) is (i)-differentiable and \( f' \) is (ii)-differentiable or

\[
L[f''(t)] = \Theta (-s^2)L[f(t)] - s f(0) \Theta f'(0)
\]

where \( f \) is (ii)-differentiable and \( f' \) is (i)-differentiable.

**Theorem:** 4 Linearity properties for FLT

Let \( f(t) \) and \( g(t) \) be continuous fuzzy-valued functions and \( c_1, c_2 \) are constants. Suppose that \( f(t)e^{-st}, g(t)e^{-st} \) are improper fuzzy Riemann integrable on \([0, \infty)\) then

\[
L[c_1f(t) + c_2g(t)] = c_1L[f(t)] + c_2L[g(t)]
\]
5 Application Of FIVPs In Mechanical Engineering

Here we consider the application of fuzzy differential equation in Mechanical Engineering. The first one is The Vibrating Mass system without damping effect and second one is The displacement of Pendulum due to damping.

Example: 1 Consider the vibrating mass system. The mass \( m = 1 \), the spring constant \( k = 4 \ lbf/ft \) and there is no or negligible damping. The forcing function is \( 2\cos t \). The differential equation of motion is:

\[
y'' + 4y = 2\cos t
\]

Subject to initial conditions

\[
y(0) = 2, y'(0) = 0
\]

Consider the fuzzy initial value problem

\[
y'' + 4y = 2\cos t
\]

\[
y(0) = [2r, 4 - 2r]
\]

\[
y'(0) = [-2 + 2r, 2 - 2r]
\]

By using Method of FLT

\[
L[y''] + 4L[y] = 2L[\cos t]
\]

By above Theorem

\[
l[y(t, r)] = \frac{2r}{s^2 + 4} + \frac{2s}{(s^2 + 4)(s^2 + 1)}
\]

\[
l[y(t, r)] = \frac{(4 - 2r)}{s^2 + 4} + \frac{2s}{(s^2 + 4)(s^2 + 1)}
\]

Hence the lower and upper bound of solution is as under respectively

\[
y(t, r) = (2r) \cos 2t + r \sin 2t - \sin 2t + \frac{2}{3} \cos t - \frac{2}{3} \cos 2t
\]

\[
y(t, r) = (4 - 2r) \cos 2t + \sin 2t - r \sin 2t + \frac{2}{3} \cos t - \frac{2}{3} \cos 2t
\]

The \( y(t, r) \) and \( y(t, r) \) at \( r = 0, 0.5, 0.8, 0.9, 1 \) are presented below in Figures.1,2,3, 4,5 respectively

\[
y(t) = y(t, 1) = y(t, 1) = \frac{2}{3} \cos t + \frac{4}{3} \cos 2t
\]
Figure 1: $y(t,r)$ and $\bar{y}(t,r)$ at $r = 0$

Figure 2: $y(t,r)$ and $\bar{y}(t,r)$ at $r = 0.5$

Figure 3: $y(t,r)$ and $\bar{y}(t,r)$ at $r = 0.8$

Figure 4: $y(t,r)$ and $\bar{y}(t,r)$ at $r = 0.9$
Example: 2 A Pendulum of length $L = \frac{8}{5} \text{ft}$ is subject to resistive force $F_R = \frac{32}{5} \frac{d\theta}{dt}$ due to damping. Determine displacement function. If $\theta(0) = 1, \theta'(0) = 2$.

The D.E is
\[
\frac{8}{5} \frac{d^2\theta}{dt^2} + \frac{32}{5} \frac{d\theta}{dt} + 32 \theta = 0
\]
With initial conditions
\[
\theta(0) = 1, \theta'(0) = 2
\]
By simplifying and converting them to Fuzzy D.E
The equation become
\[
\frac{d^2\theta}{dt^2} + 4 \frac{d\theta}{dt} + 20 \theta = 0
\]
With initial condition
\[
\theta(0) = [r, 2 - r], \theta'(0) = [1 + r, 3 - r]
\]
By using Method of FLT
By above Theorem
\[
L[\theta^2] + 4L[\theta'] + 20L[\theta] = L[0]
\]
By using Method of FLT
\[
l[\theta(t, r)] = r \frac{s + 2}{(s + 2)^2 + 16} + \left(\frac{3r + 1}{4}\right) \frac{1}{(s + 2)^2 + 16}
\]
\[
l[\dot{\theta}(t, r)] = (2 - r) \frac{s + 2}{(s + 2)^2 + 16} + \left(\frac{7 - 3r}{4}\right) \frac{1}{(s + 2)^2 + 16}
\]
Hence the lower and upper bound of solution is as under respectively
\[
\theta(t, r) = r e^{-2t} \cos 4t + \left(\frac{3r + 1}{4}\right) e^{-2t} \sin 4t
\]
\[
\dot{\theta}(t, r) = (2 - r) e^{-2t} \cos 4t + \left(\frac{7 - 3r}{4}\right) e^{-2t} \sin 4t
\]
The $\theta(t, r)$ and $\dot{\theta}(t, r)$ at $r = 0, 0.5, 0.8, 0.9, 1$ are presented below in Figures 6, 7, 8, 9, 10 respectively
\[
\theta(t) = \theta(t, 1) = \dot{\theta}(t, 1) = e^{-2t} (\cos 4t + \sin 4t)
\]
Figure 6: $\theta(t, r)$ and $\bar{\theta}(t, r)$ at $r = 0$

Figure 7: $\theta(t, r)$ and $\bar{\theta}(t, r)$ at $r = 0.5$

Figure 8: $\theta(t, r)$ and $\bar{\theta}(t, r)$ at $r = 0.8$
6 Result and Discussion

From above examples we see that the solution of FIVP is depends on the derivative i.e. (1)-differentiable or (2)-differentiable. Thus as in above examples, the solution can be adequately chosen among four cases of the strongly generalize differentiability. On the other hand, in this new procedure unicity of the solution is lost because we have four possibilities, but it is expected situation in the fuzzy context. In all the above examples, for different values of $r$ graphs for lower and upper bounds are different whereas at $r = 1$ upper bound and lower bounds are same and both the graphs are coincide.
7 Conclusion

In this paper, the Laplace transform method provided solutions to Nth-order fuzzy initial value problem but here by sake of simplicity we have considered second order FIVPs by using the strongly generalize differentiability concept. The efficiency of Method was described by solving some application based examples.
