Abstract

The rapid developments of technology which have brought with them a host of benefits to humanity have also left behind a host of spaces which have mostly aided cyber piracy who exploit the many benefits of the internet for purposes that are in their favor, but these actions which negatively affect the privacy of all internet users.

The well-known methods that have been used for a long time were also the first steps to reconstruct them so that their use is as wide as possible through one of the methods used to encrypt messages through symbols known as Pig Pen Cipher (Masonic Cipher) method is the form of displaying messages in the form of symbols, so that only the authorized person at the destination can return it to its previous state.

In this project I will present some modifications which are enabled through the 16x16 square of Dionis with 256 elements, with the help of which based on the rules I have created and developed it is different from all the others that have been presented so far containing some specific specifications within it, in order to make the possibility of decryption as difficult as possible for the abusers, but understandable to implement.

The creation and development of new rules is done through combinations of one of the algorithms for combining numbers, an algorithm created by mathematician Chen Dawei as well as through the combination of elements inside the square which in most respects will always be the same values of the sum of all the elements on its two diagonals as well as the difference between any two numbers on any two diagonals that can be formed inside the square will always have a difference of 1, while based on the shortcomings of the symbols of the Pig Pen method, the need to add symbols that will represent the space between words or the possibility that the content of the text has numbers along with some of the basic punctuation marks and basic arithmetic operations are some of the advantages of the Dionis cryptosystem.

Keywords: Encryption, Decryption, Dionis Square, Masonic Cipher
1. Introduction

By cryptographic structure we mean the transformation of a message called open text by means of an encryption function into a meaningless message called closed text, in such a way that only an authorized recipient can return the transformed message to its original state.

**Definition.** A cryptosystem is called a quintile \((P, C, K, E, D)\) that meets the conditions:

- \(P\) - is a finite family of all open texts.
- \(C\) - is a finite family of all encrypted texts.
- The \(K\) - key space is a finite family of all possible keys.
- Elements \(E\) and \(D\) are representations of \(P\) to \(C\) and \(C\) to \(P\), respectively, such that for each \(K \in K\), there is an \(e_k \in E\) encryption rule and a decryption rule \(d_k \in D\) that \(\forall x \in P\) \[d_k(e_k(x)) = x.\]

Encryption (encryption, encryption) is the conversion of data into a form called encrypted text (ciphertext), which cannot be easily understood by unauthorized persons. Decryption is the process of converting encrypted data into their original form, which can be understood.

The use of encryption and decryption is as old as communication itself. In time of war, an encryption, often mistakenly called a code, can be used to prevent an opponent from reading the broadcast content.

Encryption is often just a replacement of letters with numbers, rotation of letters in the alphabet or replacements with special symbols. The most complicated cryptostructures use powerful computer algorithms, which transform the bits into digital signals, so that the recovery of the contents of the encrypted signal is done only with the help of the correct decryption key.

Some of the forms of encrypting messages through symbols such as the well-known Pig Pen form which was used 100 years ago by Masons, also this form was used by confederate soldiers during the US Civil War. This form is constantly used to encrypt messages, but having ideas for improvement, which ideas we can use by making perhaps some changes within it, where its shortcomings are more specific as well as providing a form, which will offer more security. Therefore the need to change and develop this method is more than necessary to achieve the adequate form which would provide more symbols as well as provide more security within the sent message so that it could be used further perhaps also for encrypting messages that are of high importance.
2. Rules for the creation of "Dionis Square"

"Dionis Square" represents a matrix of type 16x16 where inside are sorted numbers from 1 to 256, a form which can be generalized in the case "n x n" where n is an even number. The importance of "Dionis Square" lies in the fact that by using the box we can place the symbols that represent the encrypted message inside the box to provide more certainty that its content and its listed form is not known to others, except the person to whom the message is intended.

Tab.1 “Dionis Square” formation process
### Rules:

2.1. The sum of all the numbers on the two diagonals of "Dionis Square" is the same on both diagonals of the 16x16 square.

\[
D = n \cdot (n^2 + 1) / 2 = 16 \cdot (16^2 + 1) / 2 = 16 \cdot (256 + 1) / 2 = 16 \cdot (257) / 2 = 4112 / 2 = 2056
\]

Tab.3
The form of placing the letters or only the symbols that represent the content of the message inside "Dionis Square" is taken based on the length of the encrypted message, with the sole purpose that only the recipient of the message can understand its content and the form of how from "Dionis Square" can be obtained encrypted message but in its correct order.

Tab.4
3.2 Placing symbols that represent the encrypted message inside "Dionis Square"

Placing the entire encrypted message inside "Dionis Square", which is enabled whenever the correct message order must be kept hidden and to exit from the box to get the correct message order must use the positions of the symbols that represent numbers placed in "Dionis Square" or even through the symbol which shows the form how all members of "Dionis Square" are visited and used to create "Dionis Square".
3.3 Exit from "Dionis Square" to get the correct order of the encrypted message

Encrypted message:

Decrypted message:

Dionis symbols can be used in encrypting messages containing letters, numbers, punctuation, arithmetic operators and comparative, ideas developed by a student who is a fan of message encryption. D. Shabani
4. Conclusion

Dionis cryptosystem using "Dionis Square" is a unique derivative of the "Pig Pen" method which can be used for various purposes. With these changes we filled in some gaps that the Pig Pen method had, as well as offering greater security especially when the message sent may be in the wrong hands so crossing from "Dionis Square" can not be done without passing from the position of any the member within "Dionis Square" in the message listed in the correct form and here also calculating the possibility offered by the method for changing the positions of letters, numbers or characters used within the sent message where this allows you to use a key inside the text of encrypted to increase the security of the encrypted message, which assures us that, even if the message can be found on the wrong person, he will not be able to understand its exact contents.

The "Dionis Square" method can be used in the military, intergovernmental communications or even education, for all crypto enthusiasts.
